## **U.S. Government Rights**

U.S. Government Rights. The Software is "commercial computer software," as defined by Federal Acquisition Regulation ("FAR") 2.101. Pursuant to FAR 12.212 and 27.405-3 and Department of Defense FAR Supplement ("DFARS") 227.7202, the U.S. government acquires commercial computer software under the same terms by which the software is customarily provided to the public. Accordingly, Keysight provides the Software to U.S. government customers under its standard commercial license, which is embodied in its End User License Agreement (EULA), a copy of which can be found at <http://www.keysight.com/find/sweula>. The license set forth in the EULA represents the exclusive authority by which the U.S. government may use, modify, distribute, or disclose the Software. The EULA and the license set forth therein, does not require or permit, among other things, that Keysight: (1) Furnish technical information related to commercial computer software or commercial computer software documentation that is not customarily provided to the public; or (2) Relinquish to, or otherwise provide, the government rights in excess of those rights customarily provided to the public to use, modify, reproduce, release, perform, display, or disclose commercial computer software or commercial computer software documentation. No additional government requirements beyond those set forth in the EULA shall apply, except to the extent that those terms, rights, or licenses are explicitly required from all providers of commercial computer software pursuant to the FAR and the DFARS and are set forth specifically in writing elsewhere in the EULA. Keysight shall be under no obligation to update, revise or otherwise modify the Software. With respect to any technical data as defined by FAR 2.101, pursuant to FAR 12.211 and 27.404.2 and DFARS 227.7102, the U.S. government acquires no greater than Limited Rights as defined in FAR 27.401 or DFAR 227.7103-5 (c), as applicable in any technical data.

This is a complete list of the technical specifications for the N5221B and N5222B PNA Series network analyzers with the following options. See block diagrams for all models and options beginning on page 57.

## 2-Port Models

**Option 200** - 2-port base model with standard test set.

**Option 201** - To base model, adds front-panel jumpers and R1 receiver switch.

**Option 205** - To base model (N5222B only), adds front-panel jumpers, R1 receiver switch, and low frequency extension (LFE) hardware.

**Option 217** - To base model, adds front-panel jumpers, R1 receiver switch, and source and receiver attenuators (extended power range).

**Option 219** - To base model, adds front-panel jumpers, R1 receiver switch, source and receiver attenuators (extended power range), and bias-tees.

## 4-Port Models

**Option 400** - 4-port base model with standard test set.

**Option 401** - To base model, adds front-panel jumpers and R1 receiver switch.

**Option 417** - To base model, adds front-panel jumpers, R1 receiver switch, and source and receiver attenuators (extended power range).

**Option 419** - To base model, adds front-panel jumpers, R1 receiver switch, source and receiver attenuators (extended power range), and bias-tees.

## Notes

This document provides technical specifications for the 85052B calibration kit, N4691B ECal module, and N4433A ECal module.

Please download our free Uncertainty Calculator from [http://www.keysight.com/find/na\\_calculator](http://www.keysight.com/find/na_calculator) to generate the curves for your calibration kit and PNA setup.

For all tables in this data sheet, the specified performance at the exact frequency of a break is the degraded value of the two specifications at that frequency.

## Definitions

All specifications and characteristics apply over a  $25^{\circ}\text{C} \pm 5^{\circ}\text{C}$  range (unless otherwise stated) and 90 minutes after the instrument has been turned on.

**Specification (spec.):** Warranted performance. Specifications include guardbands to account for the expected statistical performance distribution, measurement uncertainties, and changes in performance due to environmental conditions.

**Characteristic (char.):** A performance parameter that the product is expected to meet before it leaves the factory, but that is not verified in the field and is not covered by the product warranty. A characteristic includes the same guardbands as a specification.

**Typical (typ.):** Expected performance of an average unit which does not include guardbands. It is not covered by the product warranty.

**Nominal (nom.):** A general, descriptive term that does not imply a level of performance. It is not covered by the product warranty.

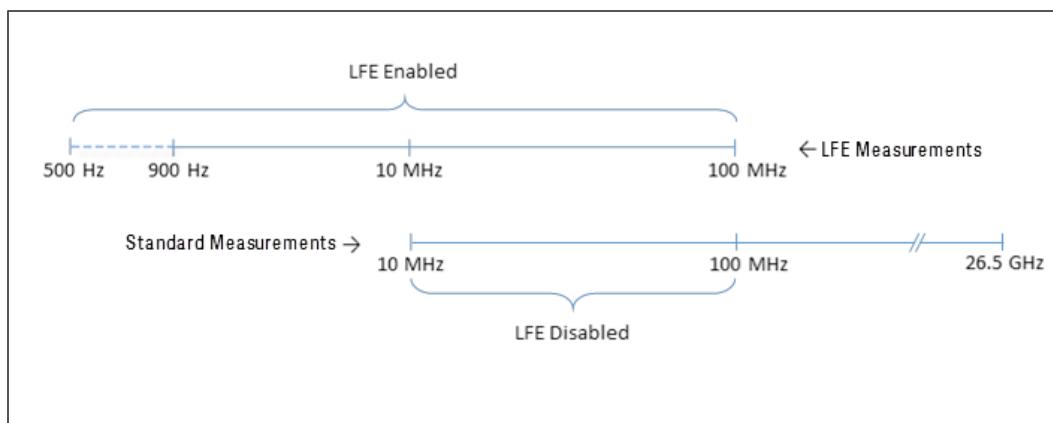

**Calibration:** The process of measuring known standards to characterize a network analyzer's systematic (repeatable) errors.

**Corrected (residual):** Indicates performance after error correction (calibration). It is determined by the quality of calibration standards and how well "known" they are, plus system repeatability, stability, and noise.

**Uncorrected (raw):** Indicates instrument performance without error correction. The uncorrected performance affects the stability of a calibration.

**Standard:** When referring to the analyzer, this includes no options unless noted otherwise.

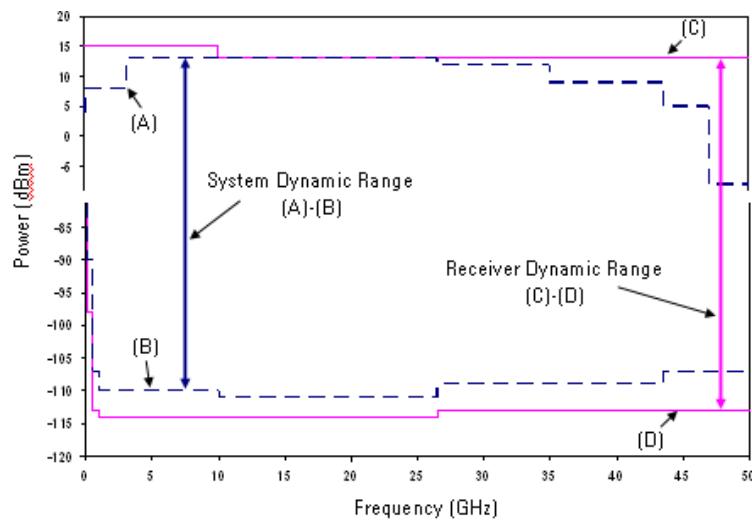

**Standard and LFE measurements:** With option 205, which adds low frequency extension (LFE) hardware, the LFE measurement range overlaps with the standard measurement range from 10 MHz to 100 MHz. With LFE Enabled, measurements from 500 Hz to 100 MHz use LFE hardware. With LFE Disabled, measurements from 10 MHz to 100 MHz use standard hardware. To measure below 10 MHz, LFE must be enabled. All measurements above 100 MHz use standard hardware, regardless of the LFE Enabled/Disabled setting.

## Dynamic Range

The specifications in this section apply for measurements made with the N5221B and N5222B PNA network analyzers with the following conditions:

- 10 Hz IF bandwidth
  - No averaging applied to data
  - Isolation calibration with an averaging factor of 8
- 
- **System Dynamic Range** is defined as the specified source maximum output power (A) minus the specified noise floor (B).
  - **Extended Dynamic Range at Direct Access Input** is defined as the specified source maximum output power (A) minus the specified direct receiver access input noise floor (not shown).
  - **Receiver Dynamic Range** is defined as the typical test port 0.1 dB compression (C) minus the typical noise floor (D).

## System Dynamic Range

50 MHz to 100 MHz <sup>1</sup>	108	108	103	123	123	118
100 MHz to 500 MHz	118	118	113	130	130	125
500 MHz to 2 GHz	127	127	123	138	138	133
2 GHz to 3.2 GHz	127	127	123	139	139	134
3.2 GHz to 10 GHz	127	127	125	141	141	139
10 GHz to 13.5 GHz	127	127	125	141	140	139
13.5 GHz to 16 GHz	127	127	124	140	139	137
16 GHz to 20 GHz	127	124	123	140	138	137
20 GHz to 24 GHz	124	121	118	136	134	133
24 GHz to 26.5 GHz	114	111	109	130	128	128

<sup>1</sup> With Option 205 installed and LFE disabled, applied to frequencies <= 100 MHz. Above 100 MHz, performance is the same for both LFE enabled or disabled.

Table 1b. System Dynamic Range at Test Port (dB), N5222B, Option 205 (LFE Enabled)

Description	Specification	Typical	Effective Dynamic Range <sup>1</sup> (Typical)
500 Hz to 900 Hz	--	105	103
900 Hz to 1 kHz	93	109	105
1 kHz to 100 kHz	103	109	99
100 kHz to 1 MHz	119	124	124
1 MHz to 5 MHz	118	125	119
5 MHz to 10 MHz	111	117	117
10 MHz to 50 MHz	110	116	116
50 MHz to 100 MHz	110	116	116

<sup>1</sup> Effective dynamic range is when the crosstalk is greater than the noise floor, and thus crosstalk limits the dynamic range. Crosstalk only limits the dynamic range for IF bandwidths < 1 kHz.

## Extended Dynamic Range

Table 2. Extended Dynamic Range at Direct Receiver Access Input (dB) - Specification

Description	Option 201, 205, 401	Option 217, 219, 417, 419

10 MHz to 50 MHz	120
50 MHz to 100 MHz	120

## Corrected System Performance, All Options

For any Sii reflection measurement:

- $S_{jj} = 0$ .

For any Sij transmission measurement:

- $S_{ji} = S_{ij}$  when  $S_{ij} \leq 1$
- $S_{ji} = 1/S_{ij}$  when  $S_{ij} > 1$
- $S_{kk} = 0$  for all k

Applies to the N5221B/2B Option 200, 201, 217, 219, 400, 401, 417 or 419 analyzers, 85131F flexible test port cable set, and a full 2-port calibration. Also applies to the following condition:

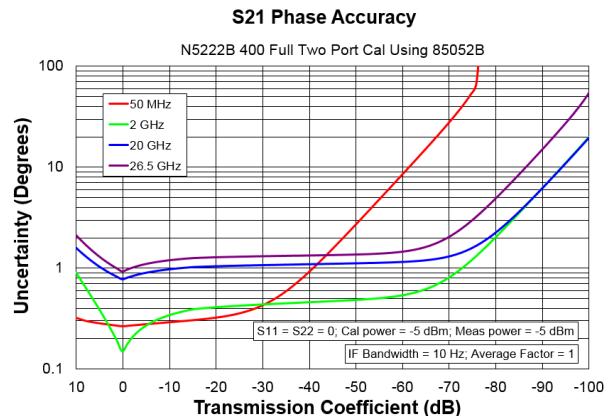

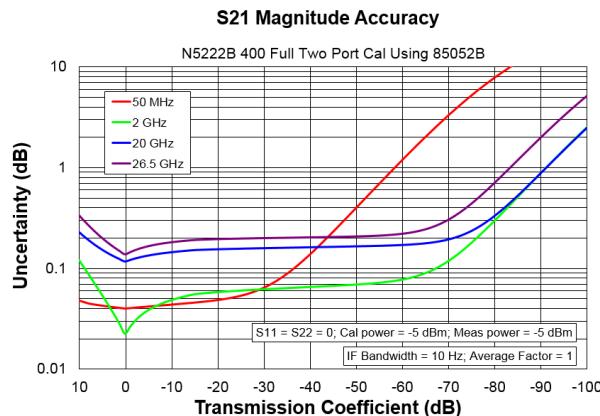

Environmental temperature  $23^\circ \pm 3^\circ \text{C}$ , with  $< 1^\circ \text{C}$  deviation from calibration temperature

## Uncorrected System Performance

Specifications apply to following conditions:

- Over environmental temperature of  $25^{\circ}\text{C} \pm 5^{\circ}\text{C}$ , with less than  $1^{\circ}\text{C}$  variation from the calibration temperature.
- Cable loss not included in Transmission Tracking.
- Crosstalk measurement conditions: normalized to a thru, measured with shorts on all ports, 10 Hz IF bandwidth, averaging factor of 8, alternate mode, source power set to the specified maximum power.

## Dynamic Accuracy

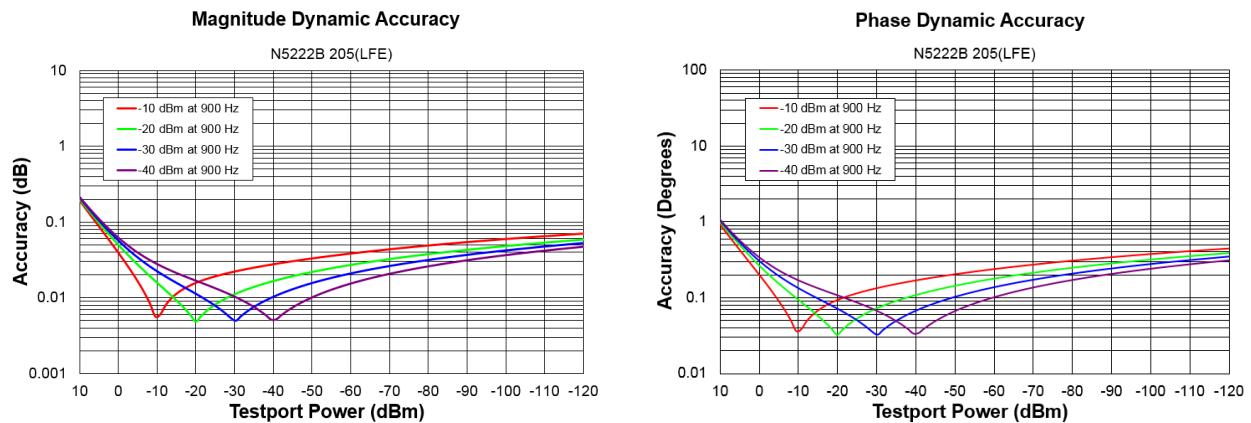

Dynamic accuracy is verified with the following measurements:

Compression over frequency

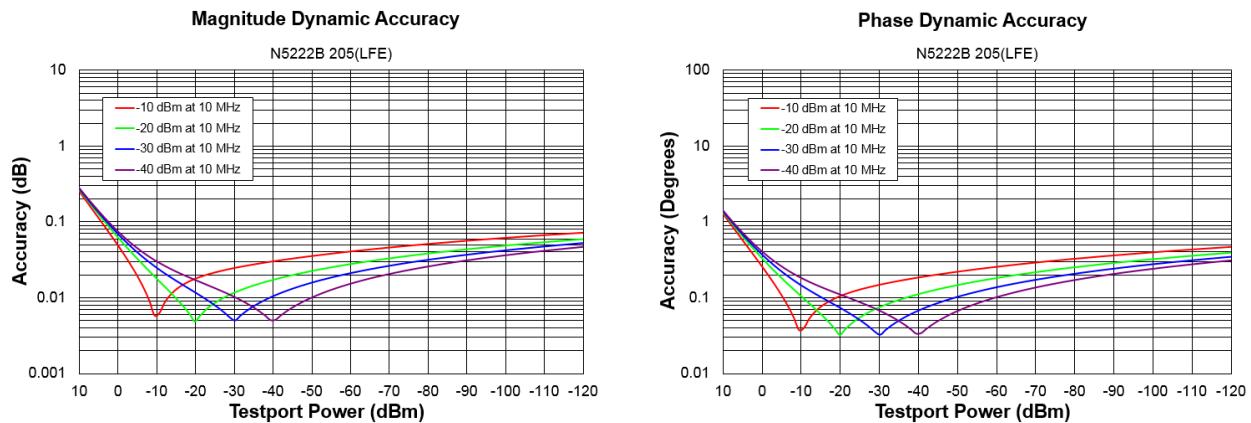

IF linearity at a single frequency of 1.998765GHz using a reference level of -20 dBm for an input power range of 0 to -60 dBm. For values below -60 dBm, refer to [VNA Receiver Dynamic Accuracy Specifications and Uncertainties](#)

Table 25. Group Delay - Typical

Group delay is computed by measuring the phase change within a specified frequency step (determined by the frequency span and the number of points per sweep). In general, the following formula can be used to determine the accuracy, in seconds, of specific group delay measurement:

$$\pm \text{Phase Accuracy (deg)} / [360 \times \text{Aperture (Hz)}]$$

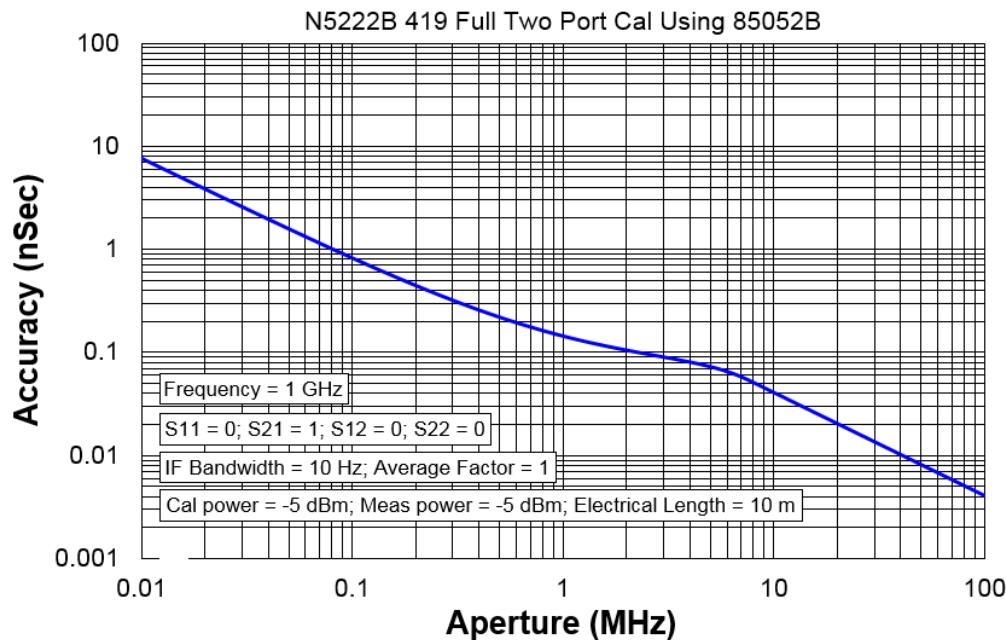

Depending on the aperture and device length, the phase accuracy used is either incremental phase accuracy or worst-case phase accuracy

Description	Typical Performance
Aperture (selectable)	(frequency span)/(number of points -1)
Maximum Aperture	20% of frequency span
Range	0.5 x (1/minimum aperture)
Maximum Delay	Limited to measuring no more than 180° of phase change within the minimum aperture.)

The following graphs show characteristic group delay accuracy with full 2-port calibration and a 10 Hz IF bandwidth. Insertion loss is assumed to be < 2 dB and electrical length to be ten meters.

For any  $S_{ij}$  Group Delay measurement,  $S_{ii} = 0$ ,  $S_{jj} = 1$ ,  $S_{ji} = 0$ ,  $S_{kl} = 0$  for all  $kl \neq ij$

Table 39. Damage Level - Typical

Description	RF (dBm)	DC (V)
RCVR A, B, C, D IN	15	7
RCVR R1, R2, R3, R4 IN	15	7
REF 1 SOURCE OUT	15	7
REF 2, 3, 4 SOURCE OUT	30	7
POR T1, 2, 3, 4 SOURCE OUT	30	7
POR T1, 2, 3, 4 CPLR THRU	30	40 (7 <sup>1</sup> )
POR T1, 2, 3, 4 CPLR ARM	30	7

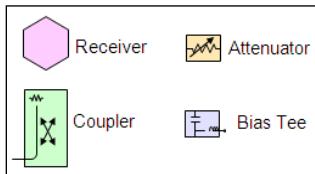

<sup>1</sup> With a thru connection between test ports of option 217 or 417 configuration, 7 VDC input to CPLR THRU ports damages the source attenuator on the connected port.

**NOTE**

For best readability, use a color printer for printing the following graphics.

**Legend**

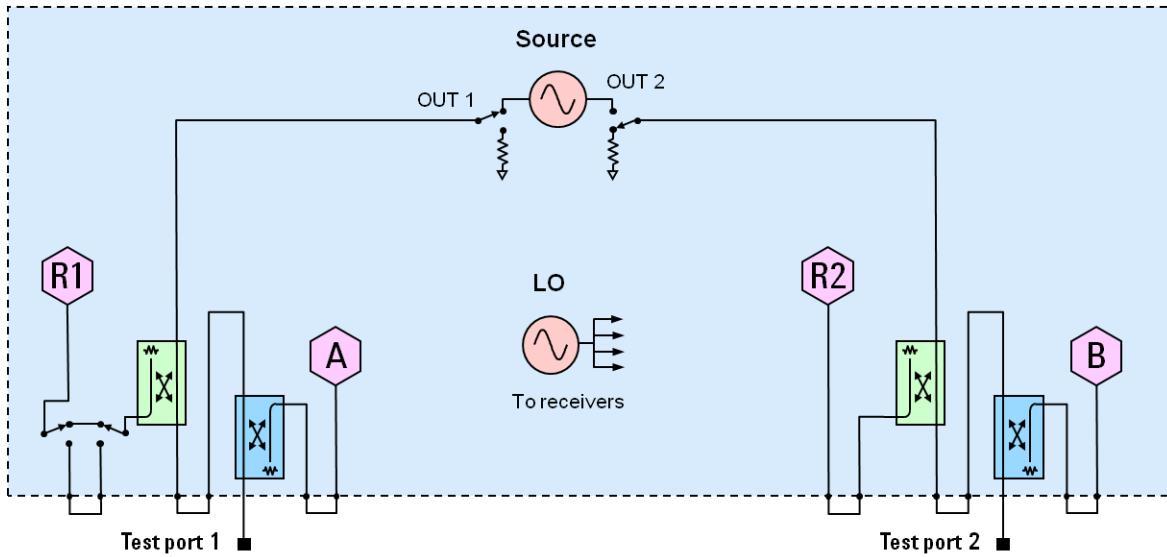

N5221B and N5222B Option 200 (2-port base model)

## N5221B and N5222B Option 201

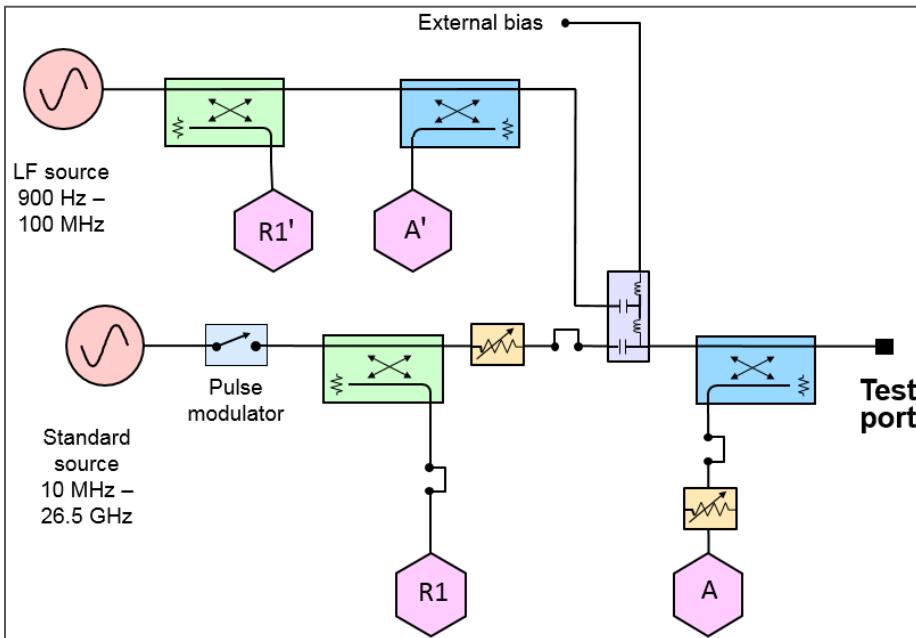

To base model, adds front-panel jumpers and R1 receiver switch

## N5222B Option 205

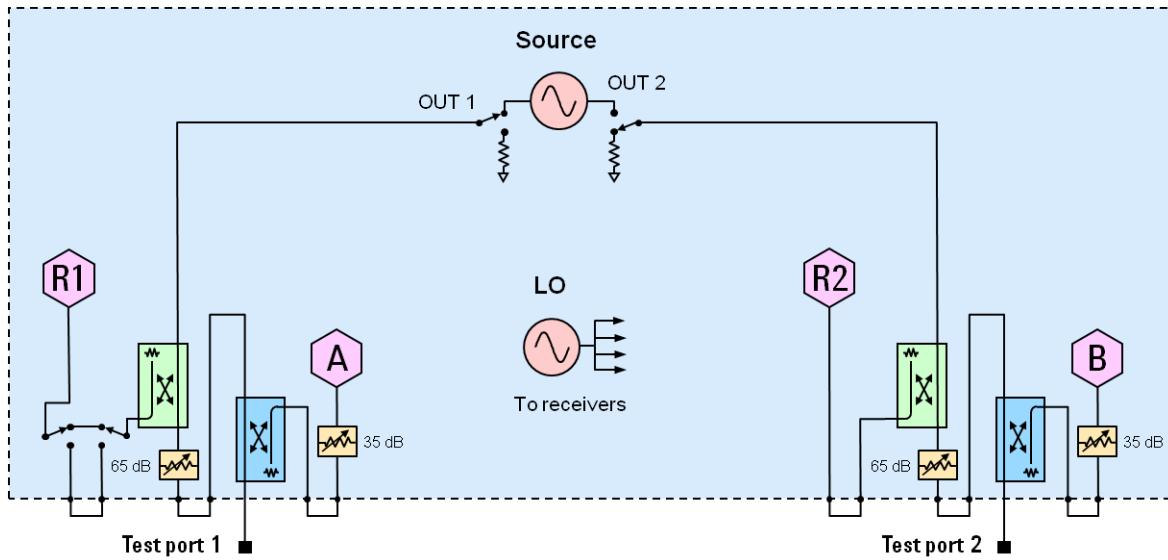

To Opt 200, adds front-panel jumpers, R1 receiver switch, and low frequency extension (LFE).

The following LFE block diagram shows how the low-frequency hardware is configured for a single test port. The other ports are configured similarly.

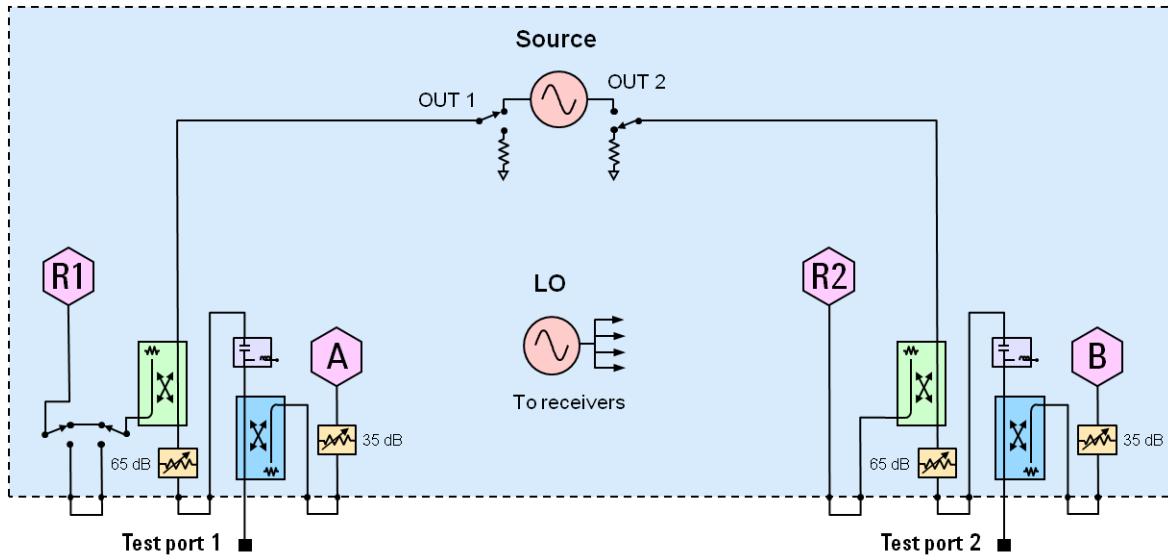

## N5221B and N5222B Option 217

To base model, adds front-panel jumpers, R1 receiver switch, and source and receiver attenuators (extended power range).

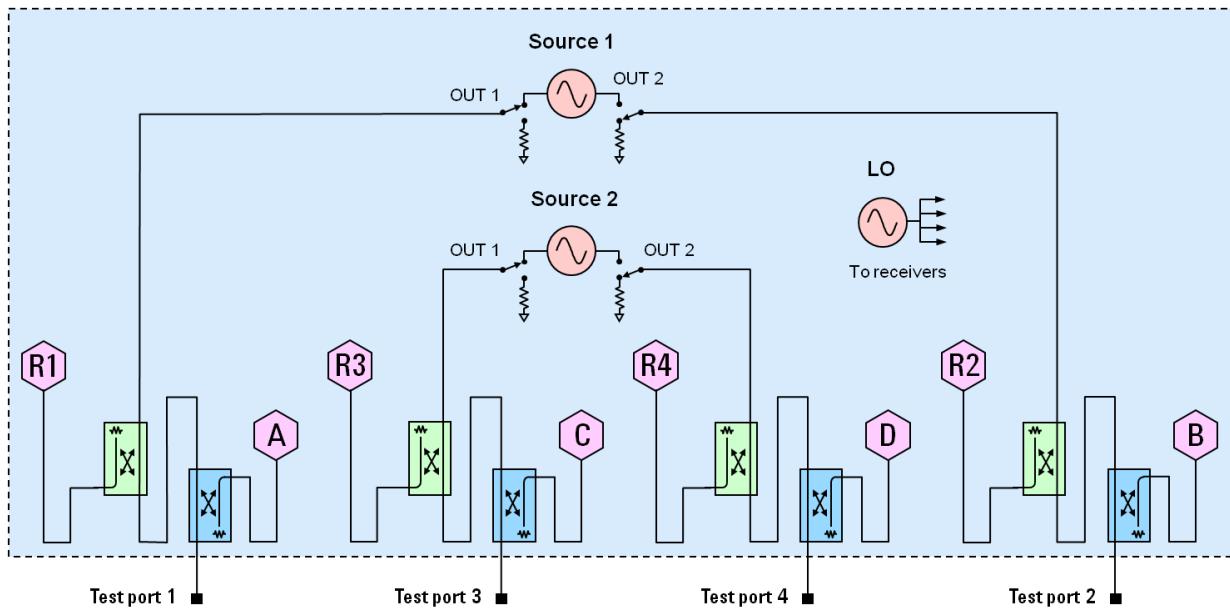

## N5221B and N5222B Option 219

To base model, adds front-panel jumpers, R1 receiver switch, source and receiver attenuators (extended power range), and bias-tees.

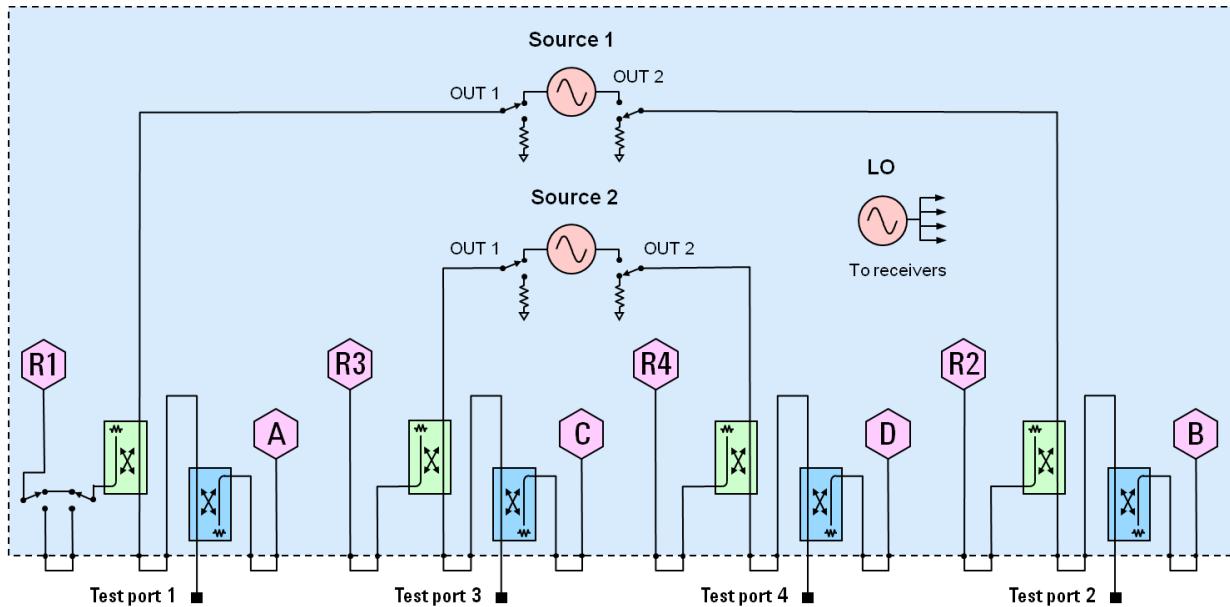

### N5221B and N5222B Option 400 (4-port base model)

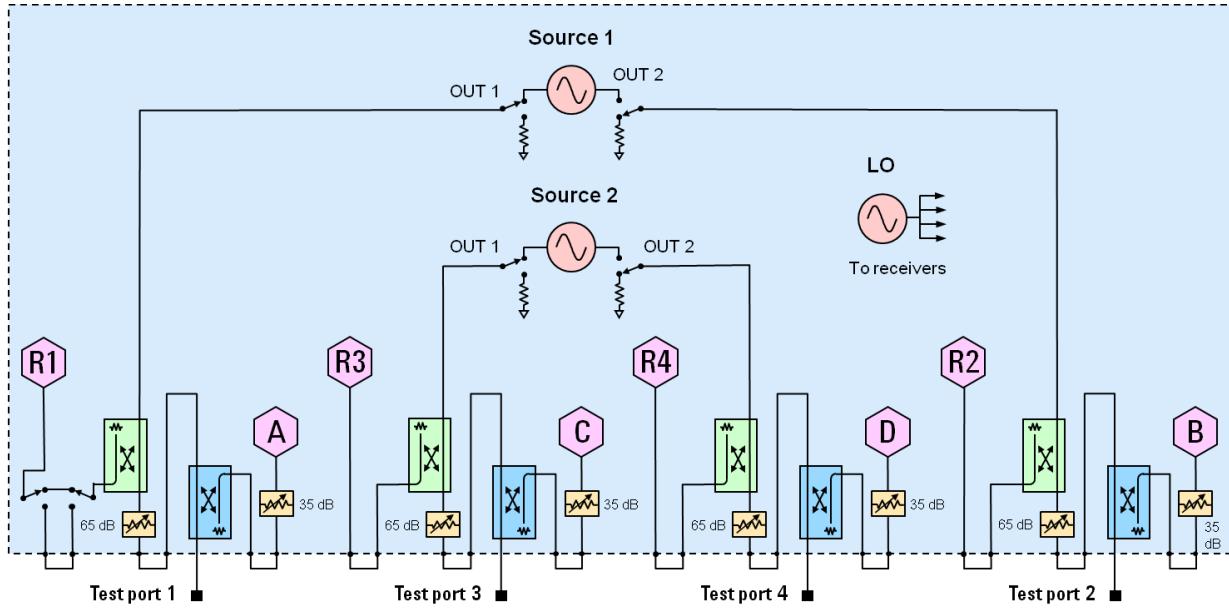

### N5221B and N5222B Option 401

To base model, adds front-panel jumpers and R1 receiver switch

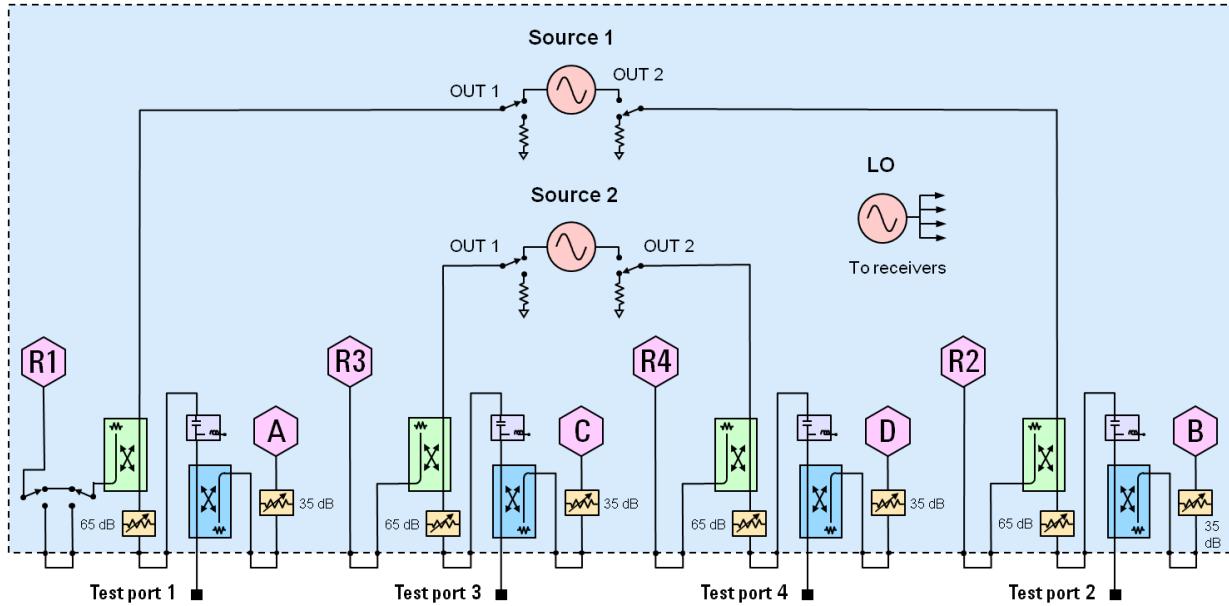

## N5221B and N5222B Option 417

To base model, adds front-panel jumpers, R1 receiver switch, and source and receiver attenuators (extended power range).

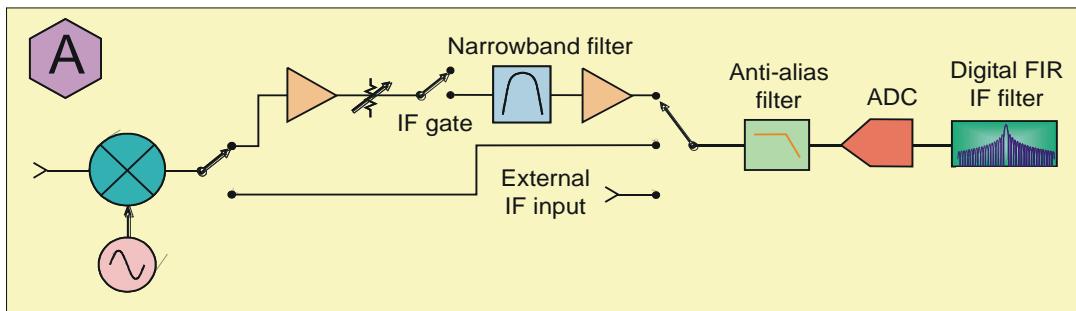

## N5221B and N5222B Option 419

To base model, adds front-panel jumpers, R1 receiver switch, source and receiver attenuators (extended power range), and bias-tees.
